

Fitting New Fence Rail

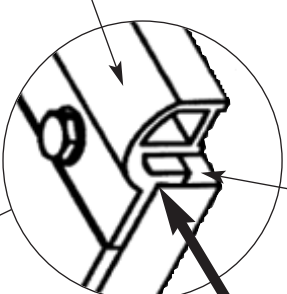

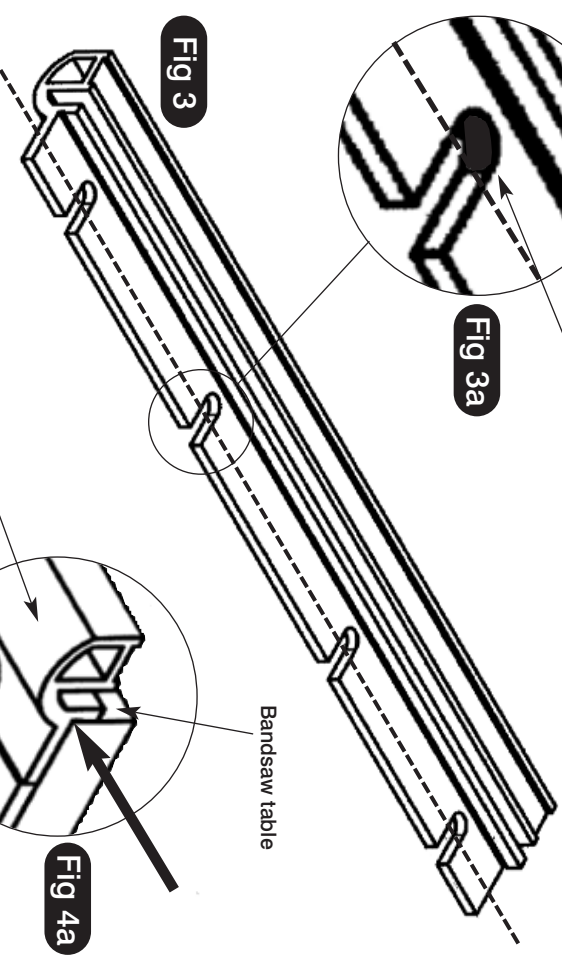

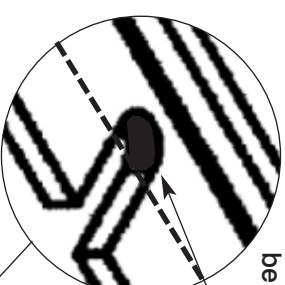

Identify the fixing method used on your handsaw. The example shown has four bolts & washers through slots cut in the 'old' fence rail.

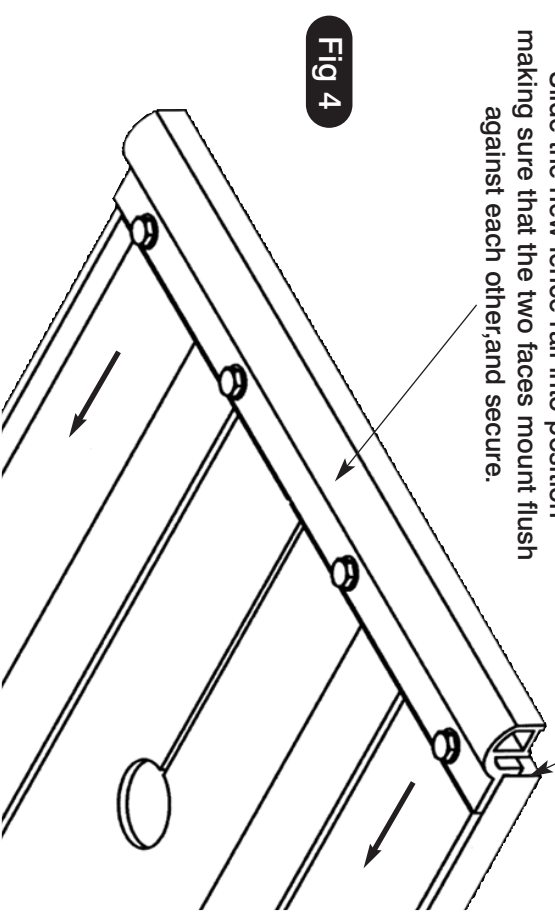

Using the old fence rail as a template place it on top of the new fence rail as shown, (Note that the new fence rail is upside down) mark the sides of the slots.

Fitting New Fence Rail

Make the slot sufficiently deep as to allow the fence to be mounted flush against the table as shown in (fig 4a).

Slide the new fence rail into position making sure that the two faces mount flush against each other, and secure.
